

DigitalShipper Web Services enables your business development team to integrate shipping capabilities into other applications providing a seamless approach to your shipping operations.

Installed on a Windows server within your network environment, DigitalShipper Web Services provides high performance shipping transactions. By eliminating the cloud you benefit from complete control over the transactions while still maintaining lower IT costs and re-usable assets.

The same Web Services are used for DigitalShipper Enterprise's standard browser-based application and Management Console, giving you the flexibility to choose which shipping processes you want to integrate into your own applications while using our standard applications for everything else – it is the best of both worlds.

DigitalShipper Web Services connects your business to all aspects of shipping from rating to carrier compliant labels to end of day processes.

Common Uses include:

- **Batch Shipping**
- **Order Fulfillment**
- **Rating Engine for Web Stores**
- **ERP/WMS Compliant Shipping**
- **Automated Conveyor Systems**
- **RF Device Pick-Pack-Ship**
- **Accessing Shipping Data**
- **Hypothetical Scenarios (carrier rate negotiations, determining new DC sites)**

Shipping Features include:

- **Full Carrier-Compliant Shipping**
- **Rate Shopping for least cost (published/negotiated rates)**
- **Rate Shopping for transit time**
- **Qualifying Carrier Services to a particular destination**
- **Generating Shipping Labels**
- **ABC Rating from any US origin to any destination worldwide**

SOA-designed Web Services – our Service-Oriented Architecture (SOA) provides your IT infrastructure with easy tools for building and extending applications. SOA is built around business processes to separate functions into distinct services that can be combined with other services or reused in application development.

Choose your own development environment and language that supports Web Services using SOAP XML messages. The WSDL-based endpoints and contract-driven approach provide a well-defined structure for using the DigitalShipper Web Services without having to be a shipping expert.
